Bo Bleyl

Pitch: BYU Glassdoor spinoff

I like the idea Braden has to keep record and create an easy way for students to see data pertaining to offers they receive from companies and their corresponding major. I think there are a lot of directions you could go with this and could potentially expand it into various other demographics as well.

I have experience with ReactJS and feel that I could be of help on the frontend as well as backend of this project. Although SQL is fairly new for me, I have extensive experience in NoSQL and could easily handle that aspect of the project with no issues. I'm always open to learning new things however and am open to jumping in wherever help is needed.

I like the comments under Business and the potential applications of this project in that space. I agree that legal shouldn't be an issue as long as we keep personal identifying information out of the data. And I think that technical for this project should be fairly straight forward. I don't believe writing out schemas for SQL or designing a NoSQL database to translate the data over to should be a very big issue.
